Abstract vii

Deutsche Kurzfassung ix
1. Einführung und Motivation ix
2. Hauptbeiträge und Gliederung der Arbeit xi

1. Introduction 1
1.1. Motivation 1
1.2. Contributions and outline of the thesis 2

2. Background 7
2.1. Biological fundamentals of gene regulation 7
2.2. Mathematical modeling of gene regulation networks 9
2.3. Measurement techniques 12

3. Identification of Boolean or discrete models of gene regulation networks 15
3.1. Introduction and problem statement 15
3.2. Polynomial representation of discrete functions 20
3.3. Reformulation of the identification problem as a linear program 27
3.4. Reduced order representation and robust estimation of unate Boolean functions 38
3.5. Application examples 41
3.6. Summary and discussion 47

4. Analysis of multistability and multistability robustness 49
4.1. Introduction and problem statement 49
4.2. Modeling framework and preliminaries 53
4.3. A combinatorial approach for the validation of multistability in gene regulation networks 58
4.4. Steady state robustness analysis and model discrimination 65
4.5. Application examples 73
4.6. Summary and discussion 79

5. Control of Boolean models of gene regulation networks 81
5.1. Introduction and problem statement 81
5.2. Representation of Boolean networks as a discrete event system 86
5.3. Application example 92
5.4. Summary and discussion 95

6. Conclusion **97**
6.1. Summary 97
6.2. Outlook 99

Appendix **101**
A. Proofs and examples for Chapter 3 101
B. Proofs and examples for Chapter 4 107
C. State attraction of discrete event systems 113

Bibliography **115**
